

User Tasks/Stories

1. Navigate to project website: <https://cs6150-solar-grid-socioeconomic-impact.vercel.app>
2. On the website, navigate to the **Education Analysis** page and read all the graphs.
3. On the website, navigate to the **Healthcare Analysis** page and read all the graphs.
4. For both sections, provide feedback regarding:
 - a. how easy the visualizations were to comprehend
 - b. suggestions on how to improve the comprehensibility of the data
 - c. how visually appealing the graphs are
 - d. suggestions to improve the graph layouts
 - e. does the data seem properly represented in the graphs
 - f. suggestions on different ways to represent the data

The related part of the meeting video starts at 38:30.

Likes About Current Project & Suggestions for Improving Final Deliverable

Dr. Selby found the website's visualizations and information to be clear, visually appealing, and accurate in representing the data.

Dr. Selby suggested the following improvements:

- ensure that our interpretation of the results are proper interpretations (finding correlations, assessing implications, etc.) rather than simply restating the results
- conduct an analysis to see what is known about the directionality for different relationships (i.e. school performance change based on gender (boys vs girls), household headcount change, etc.)
- suggested not binarizing all variables & treating as ordinal variable instead of binary variable
- find corroborating evidence for data interpretations for Renewvia's study using other research papers
- to be careful with wording and phrasing. It should be worded as if they are possible interpretations and explanations, rather than facts.

Deployment Plan

In our October 31st meeting with Dr. Selby, we discussed our plans and agreed to publish a letter in a journal by the end of the semester. At that time, we will provide Dr. Selby with the finalized letter and a zip file containing all the data and research compiled over the semester. The video link above includes the communication between Dr. Selby and our team regarding our plan.

There were no new findings from our meeting that influenced the deployment plan.

Sustainability Analysis

Our project focuses on data analysis and deriving text insights from a previous study conducted by our partner organization, culminating in a journal letter publication. This project is designed to be highly sustainable for our partner, as it requires no future maintenance costs or external support. At project completion, we will provide our partner with all data and research in a readily accessible format, including image and text files, ensuring that they can independently manage and reference this information going forward.

There were no new findings from our meeting with Dr. Selby that influenced the sustainability analysis.

Individual Team Member Contribution

Sophia Wu

- Project management & logistics: writing agenda and leading meetings, assigning and splitting tasks between members for all future remaining assignments based on deadlines
- Used recorded meeting from October 31st meeting with Dr. Selby to complete P7 Field Evaluation assignment

Brock Pace

- Researched into different journals accepting letters to publish (ACS Energy Letters, Advanced Science Letters, Renewable Energy, Energy Research and Social Science, Renewable and Sustainable Energy Reviews)
- Worked on completing the outline for a paper and will send this outline to Dr. Selby for revision and approval

Xiaobo Ren

- Created bullet point summarizations of researched data for ease of referral and understanding of graphs for non-data team

Bokyoung Won

- Created bullet point summarizations of researched data for ease of referral and understanding of graphs for non-data team
